# Are you prepared to charge at home?

## Up to 80% of electric vehicle charging is done at home

You can plug your electric vehicle into a standard 120-volt household outlet (Level 1) but it isn't a practical way to charge. A 240-volt charging station (Level 2) is recommended for a faster charge.

Most dealers will sell you a charger or you can purchase them elsewhere. A local electrician or MiEnergy can provide recommendations.

A Level 2 charger should be installed by a licensed electrician and it may require an upgrade to your service panel.

Federal tax credits are available for the installation of a Level 2 charger. MiEnergy has rebates available to members that are on an electric charging rate.

**Contact MiEnergy for more information about electric vehicle charging, rebates and tax credits.**
